Industry News

Endomines reported the intersection of high-grade gold from its 2023 drill program at the Kuittila prospect along the Karelian gold line. Drill hole KT-015 returned 9.75m @ 17.4g/t Au & 0.12% Mo, including 0.9m @ 157g/t Au & 0.05% Mo as well as 3.9m @ 6.7g/t Au & 0.01% Mo, including 1.1m @ 19.7g/t Au & 0.01% Mo.

The newly intersected gold mineralization is associated with strongly sheared quartz veins within a tonalite and extends the known mineralization at Kuittila towards the South. The company notes that the intersected mineralization is of a different style than the previously released high-grade polymetallic intersection in drill hole KT-007 (18.0m @ 5.0g/t Au, 173.6g/t Ag, 1.2% Pb, 0.8% Zn, 0.1% Cu, and 0.02% Mo). Logging and assaying of the remaining drill core is ongoing.

Industry News

Aurion Resources reported new assay results from its Kaaresselkä prospect. Gold mineralization was encountered in every hole with highlighted assay results returning e.g. 8.25g/t Au over 4.30m in drill hole KS23034. Mineralization at the Vanha trend is now defined for more than 500m along strike with the system remaining open at depth and along strike.

Notably, drilling also intersected a new zone of gold mineralization further to the north, returning e.g. 63.20g/t Au over 0.85m in drill hole KS23041.
